

Research Statement

Mohamed Jassar

Motivation. Research in an academic environment provides a unique opportunity to solve problems and vision the technology of the future. My current research interests are concerned with the development of methods and algorithms for Information Security. Computer security is becoming ubiquitous in all segments of life ranging from entertainment such feature films and computer games to more serious applications like medical and scientific data visualization. In the past two decades there have been many advances in the field of Information Security and information Technology. Despite numerous technological advances in both graphics hardware as well as algorithms, there are many challenging problems that still limit realism and effectiveness of Information Security. My main research goal is secure the Network, tools and algorithms for efficient generation of information security.

Research Philosophy. I do believe that a strong understanding of the problem is extremely important. There are numerous fields related to Information Security that produced a great body of work that could be applied to Information Technology and provide insights on how to improve existing algorithms and design new approaches. Understanding the problem and gaining insights has allowed me to made approximations that were more user friendly and faster to compute without Vulnerable. I greatly value theoretical work, because theoretical investigations could lead to some very practical suggestion on how to improve existing methods or design yet unexplored methods.

Previous Work. My main focus of research has been DESIGN-OF-ROUTING-PROTOCOL-FOR-UNDERWATER-WIRELESS-SENSOR-NETWORK. All routing protocol performs specific task in underwater wireless sensor network(UWSN). Routing is responsible for networking problems. The main design issues of the routing protocols for UWSN are Bandwidth capacity, problem related to low energy, node mobility and high propagation delays. In this project Dynamic route discovery, Cluster.

To conduct productive research I am looking forward to learning much more than I know now. Interaction with peers, students, and learning more about

what other research areas have to offer will all contribute to new ideas and exciting research. Information Security is the area full of exciting problems and I look forward to working on them.

Further information about my current research and electronic versions of my publications are available at <https://github.com/jaserjasar>
